In mathematics, the tangent space of a manifold facilitates the generalization of vectors from affine spaces to general manifolds, since in the latter case one cannot simply subtract two points to obtain a vector that gives the displacement of the one point from the other.

In recent years, considerable progress has been made in studying algebraic cycles using infinitesimal methods. These methods have usually been applied to Hodge-theoretic constructions such as the cycle class and the Abel-Jacobi map. Substantial advances have also occurred in the infinitesimal theory for subvarieties of a given smooth variety ...

Tangent spaces on manifolds. Now consider defining tangent spaces on manifolds. Intuitively, the tangent space at a point on an  $n$ -dimensional manifold is an  $n$ -dimensional hyperplane in that best approximates around  $p$ , when the hyperplane origin is translated to  $p$ . This is depicted in Figure 8.8.

for all real number  $x$  and  $t > 0$ . Then the tangent space to  $T$  at the identity map is the set of all functions  $H$  on the unit circle which satisfy the condition  $H \hat{\in} \Lambda$  and the normalized conditions

So a tangent space is the space spanned by the tangent vectors of curves lying in that space. A bit more is involved in clarifying what this means. The simplest concept of tangent space to understand is the vector space of translations on an affine space (like a Euclidean plane). Given points  $P$  and  $Q$ , there is a unique translation which takes  $P$  to  $Q$ .

This video looks at the idea of a tangent space at an arbitrary point to any given manifold in which vectors exist. It shows how vectors expressed as directional derivatives form a basis for the ...
